anaptis Configuration

Variant configurator within Dynamics 365 Business Central assembly

anaptis GmbH

Medium-sized companies from a wide variety of industries use our software to improve managing their resources and processes and making them more efficient. In addition to the standard ERP solution Microsoft Dynamics 365 Business Central (formerly NAV/Navision), we also implement industry-specific enhancements - among others in cooperation with our partners.

Your challenge without the add-on

You will know the problem: You can create items with multiple variants in the system standard of Dynamics 365 Business Central (formerly Dynamics NAV/Navision), but only one BOM per item. This means that you cannot create different assembly parts lists for each variant. Let's assume you produce furniture. Example: You could create the basic item "Table" with the variants "Red", "Yellow" and "Blue" as well as a BOM for this item. However, you cannot create individual assembly parts lists for each variant (e.g. a blue table top for a blue table). How have companies solved this so far? Some have created variants as separate articles. However, this bloats the article master, you lose the overview and there are probably a lot of duplicate variants. Others use alternative add-ons from the competition. These have usually been developed for complex production processes and are too large for many companies.

Our solution: anaptis Configuration

With the help of our app or our variant configurator anaptis Configuration for Dynamics 365 Business Central, you can create your own variants with individual assembly parts lists within an article. Example: Let's assume again that you produce furniture. Using anaptis Configuration, you can set up the basic item "table" in the system and add a "red" variant with an assembly parts list including a red table top, a "yellow" variant with an assembly parts list including a yellow table top, etc.

All functions at a glance:

- Create variant manually
- Create variant from document (e.g. from order, quotation)
- Check duplicates
- Define resource types in the assembly parts list (e.g. components, machines, employees)

Comparision: System standard vs. app

We summarize once again: How does the app extend the Dynamics 365 Business Central/NAV system standard?

Criteria	System standard	anaptis Configuration
Creation of different assembly parts lists per variant	– only as a detour by creating a separate item	✓ order-related from the sales line (flexible regarding special designs and individual orders)
Customer-related packaging of	– only by creating s separate item (a lot of effort)	✓ directly from the sales line (little effort

an item		
Adding resources (machines or employees)	✓ new creation of an item, if necessary	✓ possible in advance, directly from the sales line
Automatic identification of duplicates	–	✓

Benefits of anaptis Configuration
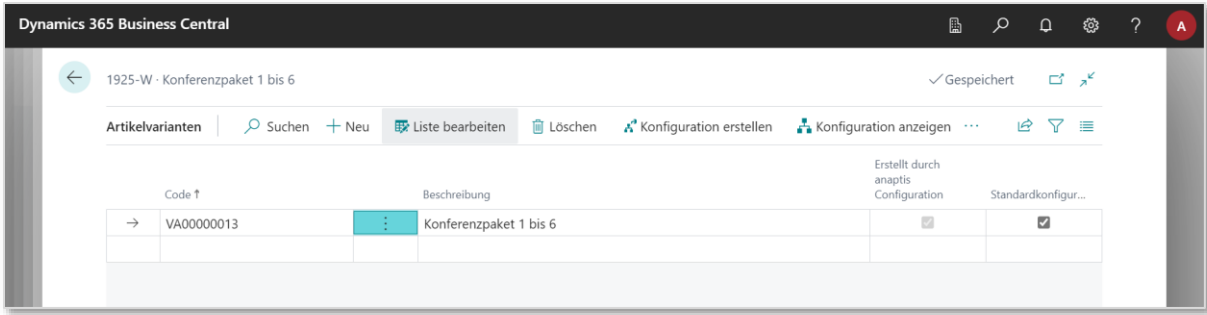

Easy Handling	Better Overview	Less Effort
